January 2020
Morning Sky

1 hour before sunrise at midmonth

The star map is drawn for 43-degrees north latitude, but is useful for other nearby latitudes. Planet positions are shown for mid-month.

TO USE STAR MAP:
Hold map over your head with "NORTH" pointing toward the northern horizon on the earth. The center of the map, the zenith, marks the point directly overhead. The position of the constellations on the star map will match the night sky.
